                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5403 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a Streptococcus that is particularly S. agalactiae and S. pyrogenes. Oli. A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meniatis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography.immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent patent WO20017734 (published 18-OCT-2001) which is available in electronic format directly from WIPO at Etp.wipo.int/pub/published_pct_sequences. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment opathological conditions resulting from bacterial infection.
                                                                                                                                                          Gaps

Antisense; prokaryotic essential gene; cell proliferation; drug design.

Burkholderia mallei.

WO200277183-A2.

03-OCT-2002

Protein encoded by Prokaryotic essential gene #7941.

(first entry)

19-JUN-2003

ABU22414;

ABU22414 standard; protein; 506 AA.

RESULT 15

```
The first sense sequences given in the specification where expression of the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway in which a proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene present in a culture or collection of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Zyskind JW;

proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequences

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

J. Sequence 6, Application US/08415751

J. Patent No. 5643772

J. GERREAL INFORMATION:

RAPLICANT: BEECH, JAMES

APPLICANT: BEECH, JAMES

APPLICANT: BEECH, JAMES

APPLICANT: GUT, JIRI

TITLE OF INVENTION: CRYPTOSPORIDIUM ANTIBODIES, D

TITLE OF INVENTION: CRYPTOSPORIDIUM ANTIBODIES, D

TITLE OF INVENTION: AND RNA ENCODING THEM, HYBRID

TITLE OF INVENTION: WECTOR AND TRANSPORMED HOST A

TITLE OF INVENTION: WETHORS FOR IMMUNOTHERAPY AND

TITLE OF INVENTION: DIAGNOSIS AND KIT

NUMBER OF SEQUENCES: 50

CORRESPONDENCE ADDRESS:

ADDRESSEE: PHILLIPS, MOORE, LEMPIO & FINLEY

STATE: Palo Alto

COTTY: Palo Alto

STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        REGISTRATION NUMBER: 30,518

#### ALIGNMENTS

Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypothensive, antidiabetic; vulnerary; call surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor. VEGFR-3 binding peptide SEQ ID NO:67. 7 A. ABP53964 standard; peptide; (first entry)

/note= "X is any amino acid" Location/Qualifiers

Kubo H;

New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

Claim 21; Page 81; 149pp; English.

The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive,

```
antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, liver, spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cyclized

the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a somatostatin analogue of the invention. The invention relates to a backbone cyclised somatostatin analogue that has one building unit containing a nitrogen atom of the peptide backbone connected to a bridging group comprising an amide, thioether, thioester

such as cancers, autoimmune diseases, endocrine disorders, diabeticas associated complications, gastrointeetinal disorders, inflammatory diseases, pancreatitis, atherosclerosis, restenosis and post-aurgical pain. It may also be used for diagnosing cancer. The backbone cyclic analogues is used for imaging the existence of metastases. Somatostatin analogues can be used for the treatment patients with hormone-secreting and hormone-dependent tumours. They reduce diarrhoea through the inhibition of vasoactive intestinal peptide (VIP) secretion and by direct effect on intestinal secretion. Somatostatin analogues selective to type 2 and 5 receptors may be used for treatment of non-insulin dependent diabetes mellitus. They are useful for the prevention of atherosclerosis and restenosis. The analogues are metabolically stable, selective in their in-vivo activities and safe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                somatotropin release inhibiting factor; somatostatin receptor subtype; synthesis; antiarteriosclerotic; immunosuppressive; cytostatic; cancer; antidiaetic; antiinflammatory; somatostatin receptor ligand; atherosclerosis; autoimmune disease; diabetic-associated complication; endocrine disorder; inflammation; gastrointestinal disorder; restenosis; pancreatitis; post-surgical pain.
                          group to form a cyclic structure with a moiety selected from a second building unit, side chain of or N-terminal amino acid residue. A composition containing the analogue may be used for preventing disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Backbone cyclised somatostatin analogue; somatostatin; SRIF; analgesic;

The present invention describes backbone cyclised somatostatin analogues

(I) that incorporates at least one building unit containing one nitrogen

atom of the peptide backbone connected to a bridging group (comprising an

amide, thioether, thioester or disulfield where at least one building

connected wis the bridging group to form a cyclic structure with

a moiety selected from the group consisting of a second building unit,

the side chain of an amino acid residue of the sequence or the N-terminal

connected, antidiabetic, antiarfammatory and analogust activities, and

cytostatic, antidiabetic, antiinflammatory and analogus activities, and

cytostatic, antidiabetic, autoimmune diseases, cancers, diabetic-

cytostatic, antidiabetic, autoimmune diseases, cancers, diabetic-

crastenant of atherosclerosis, autoimmune diseases, cancers, diabetic-

associated complications, endocrine disorders, inflammation,

consistent disorders, pancreatitis, post-surgical pain, and

consistent also be used in the diagnosis of cancer, by imaging

the existence of metastases, it being labeled with a detectable probe.

The present sequence represents a backbone cyclised somatostatin analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.

          The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of
                                                                                                                                                                                                                                            escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigene can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPIISOI to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.

The present invention describes a composition (I) comprising a prepared

```
group-based vaccines has several advantages over traditional vaccines, group-based vaccines has several advantages over traditional vaccines, compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of Viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (cTL and HTL), and further, to modify the immunogenicity Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. Asplication of the groups disease. Similar engineering of the response is not possible with traditional approaches. Asplication of the present in the exemplification of the present enventon. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1.
human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (1) has virucide activity and can be used in vaccines. (1) be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines group-based vaccines has several advantages over traditional vaccines compositions. There is evidence that the immune response to whole antigens in vaccine antigens is directed largely toward variable regions of the antigen, callowing for immune secape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of the sacape mutants. Furthermore, immunosupressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. Application of the present regimeering of the present repetates engences used in the examplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a composition (1) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (1) has virucide activity and can be used in vaccines. (1) may be used for immunising subjects against HIV-1 infections. The use of
ABP25397). (I) has virucide activity and can be used in vaccines. (I) may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against {\rm HIV}-1.

particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                 ö
group-based vaccines has several advantages over traditional vaccines,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to lanthionine bridged peptides which are analogues of peptide compounds comprising a disulphide bridge. The disulphide bridge or thioether bond, designated a lanthionine bridge. Such analogues or lanthionine bridge peptides have improved biological activity compared to the original peptide compounds e.g. vasopressin, somatostatin, enkephalin, and endothelin. The lanthionine-bridged peptides are useful as
                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                     Lanthionine bridged peptide; monosulphide bridge; thioether bond; improved biological activity; vasopressin; somatostatin; enkephalin; endothelin; pharmaceutically active compound.
                        The lanthionine bridged peptide is an analog cpd. of a naturally occurring biologically active peptide, having improved properties. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "Modified by C-terminal amide (NH2) group'

The specification describes a metallo-construct, which may be a peptide, comprising metal ion-binding backbone for complexing with a metal ion and a biological function domain which is conformationally constrained upon complexing the metal ion-binding backbone with a metal ion. The peptide/metal ion complexes are less susceptible to proteolysis than the uncomplexed peptides. The peptides lack conformational restriction if not complexed to a metal ion, so that the uncomplexed peptides are either inactive or low in potency. The complexed peptides may also exhibit altered biodistribution profiles, rate of clearance from the body and bioavailability. The constructs/peptides are useful as biological, therapeutic, diagnostic imaging and radiotherapeutic agents, or in the peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Metallo-constructs comprising a metal ion-binding backbone for complexing metals - and a biological function domain which may be converted from inactive to active form on binding of the construct to a metal ion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This peptide comprises a motif located at amino acid residues 312-319 of the galactanase of Myceliophthora thermophila CBS 117.65 (see AAW27063) and at amino acid residues 311-318 of the galactanase of Humicola insolates DR 1800 (see AAW27064). Another motif (see AAW27065) has also been identified. These motifs are characteristic of galactanases of fungi of the order Sordariales. PCR primers (see AAR35060-61) based on the motifs can be used to identify galactanase enzymes in Sordariales fungi. Such enzymes have an optimum pH above 5.8 and are useful in the food and feed industries, as well as in wine and juice processing. (Updated on 25-MAR-2003 to correct PI field.) Backbone cyclised somatostatin analogue PTR 3177.

(first entry)

19-NOV-2002

ABP53416;

```
invention relates to a backbone containing an introgen at the period backbone cone building unit containing a nitrogen atom of the peptide backbone connected to a bridging group comprising an amide, thioether, thioester or disulphide. At least one building unit is connected via a bridging group to form a cyclic structure with a moiety selected from a second group to form a cyclic structure with a moiety selected from a second of building unit, side chain of or N-terminal amino acid residue. A composition containing the analogue may be used for preventing disorders such as cancers, autoimmune diseases, endocrine disorders, diabetic associated complications, gastrointestinal disorders, inflammatory diseases, pancreatitis, atherosclerosis, restenosis and post-surgical pain. It may also be used for disagnosing cancer. The backbone cyclic analogue is used for imaging the existence of metastasses. Somatostatin and hormone-dependent tumours. They reduce diarrhoea through the inhibition of vasoactive intestinal peptide (VIP) secretion and by direct
Somatostatin analogue; therapy; cyclic peptide; autoimmune disease; endocrine disorder; cancer; diabetic-associated complication; diagnosis; gastrointestinal disorder; inflammatory disease; panoreatitis; atherosclerosis; restenosis; post-surgical pain; VIP secretion inhibitor; hormone-secreting tumour; hormone-dependent tumour; diarrhoea; vasoactive intestinal peptide; non-insulin dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cyclized somatostatin analogs for inhibiting growth hormone secretion from anterior pituitary and as antiproliferative agents for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  effect on intestinal secretion. Somatostatin analogues selective to type 2 and 5 receptors may be used for treatment of non-insulin dependent diabetes mellitus. They are useful for the prevention of atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a somatostatin analogue of the invention. ```
The present invention describes backbone cyclised somatostatin analogues

(I) that incorporates at least one building unit containing one nitrogen

atom of the peptide backbone connected to a bridging group (comprising an

amide, thioether, thioester or disulfide) where at least one building

unit is connected via the bridging group to form a cyclic structure with

a moiety selected from the group consisting of a second building unit,

the side chain of an amino acid residue of the sequence or the N-terminal

amino acid residue. (I) has antiarteriosoferotic, immunosuppressive,

cytostatic, antidiabetic, antiinflammatory and analgesic activities, and

cytostatic antidiabetic, autiinflammatory and analgesic activities, and

cytostatic antidiabetic, antiinflammatory inflammatory and analgesic activities, and

creatment of atherosclerosis, autoimmune diseases, cancers, diabetic-

associated complications, endocrine disorders, inflammation,

creatmosts. (I) can also be used in the diagnosis of cancer, by imaging

the existence of metastases, it baing labeled with a detectable probe.

The present sequence represents a backbone cyclised somatostatin analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
Sequence 94, Application US/09069827A
Patent No. 6617114
GENERAL INPORMATION:
APPLICANT: FOWLKES, Dana M
KAY, Brian K
FRELINGER, Jeffrey A
HYDE-DERVISCHER, Robin P
TITLE OF INVENTION: IDENTIFICATION OF DRUGS USING
COMPLEMENTARY COMBINATORIAL LIBRARIES
                                                                                                                                                                                                                                                                                                STATE: WASHINGTON
STATE: D.C.
COUNTRY: U.S.A.
ZIP: 20001
COMPUTER READBLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/09/069,827A
FILING DATE: 31-Apr-1998
CLASSIFICATION : CURNOWN>
PRIOR APPLICATION NUMBER: US 09/050,359
FILING DATE: 31-ARR-1998

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TITLE:
```

```
LOCATION: -4

IDENTIFICATION METHOD: amino acid analysis

IDENTIFICATION METHOD: and

IDENTIFICATION METHOD: and

IDENTIFICATION METHOD: anse spectrometry

OTHER INFORMATION: water is removed and

OTHER INFORMATION: thereby

OTHER INFORMATION: a -S - bridge is present between Cys and Ser
